

COSMODOT

END-TO-END TRACEABILITY OF SAND-CASTING
PRODUCTION WITH CDOT CODE MARKED ON
SAND MOLD AND TRACK THROUGHOUT WHOLE
PROCESSES

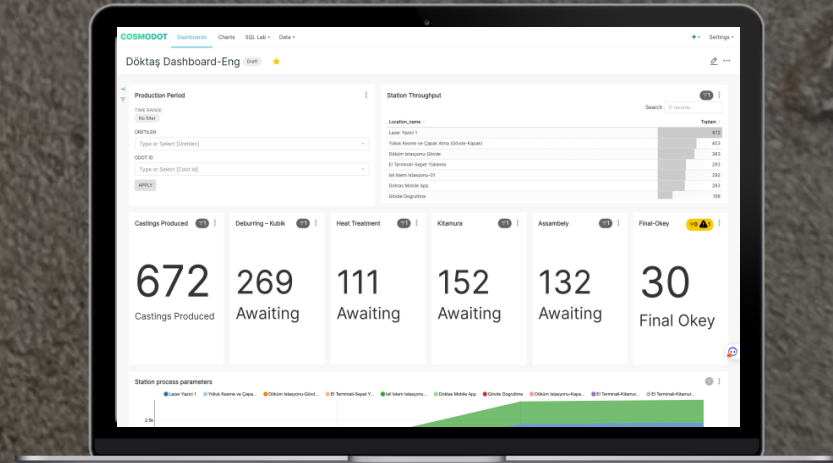

Tunç Acarkan
Head of Technology Transfer & Sales

About Cosmodot

- ❑ Industrial deep tech start-up established in 2020
- ❑ Present in United States & Türkiye
- ❑ Inventors of the CDOT code

CDOT Code

CTRACE real-time traceability platform

100% Good Read Results

Applicable to 30+ Materials

For 20+ Heavy Processes & Conditions

AI-Compatible Code

Traceability in Sand Casting

Industry 4.0 can Unlock Significant Value in Production

Reduction in
Cost of Stock

Increase in
Workforce Efficiency

Reduction in
Machine Downtime

Increase in
Production Capacity

Increase in
Production Forecast

Reduction in
Cost of quality

CDOT addresses <Bad Data Quality from Things> and creates a new opportunity space for Industrial AI to achieve industrial value transformation

“Visible problems are often caused by accumulations of invisible factors, such as the decline of equipment leading to shut down, the lack of accuracy leading to product quality deviation, and so on. Like an iceberg, the visible problem is only part of the entire issue, while the hidden problems are larger but unseen. The function of big data and AI technology is to predict the invisible problems in production to obtain the means to avoid and solve the invisible problems. This will create carefree manufacturing.”

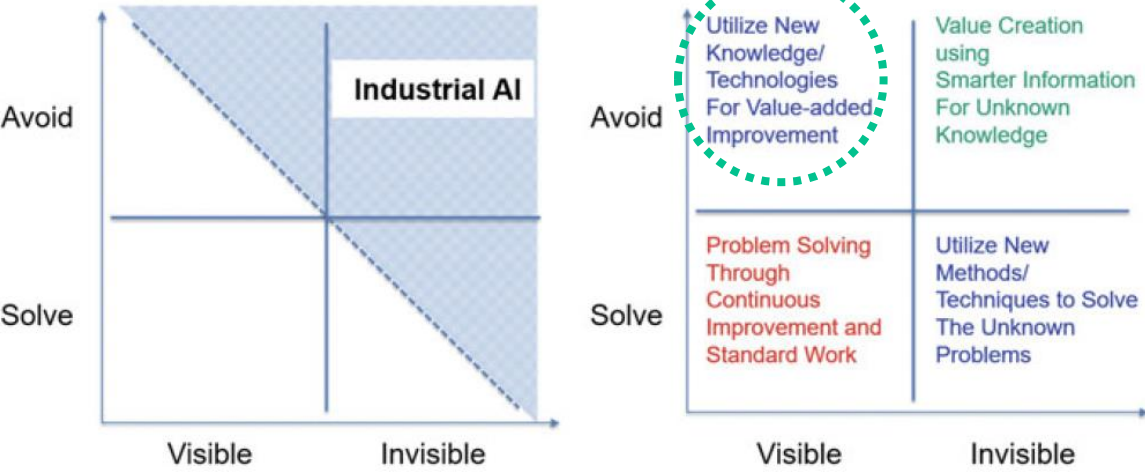

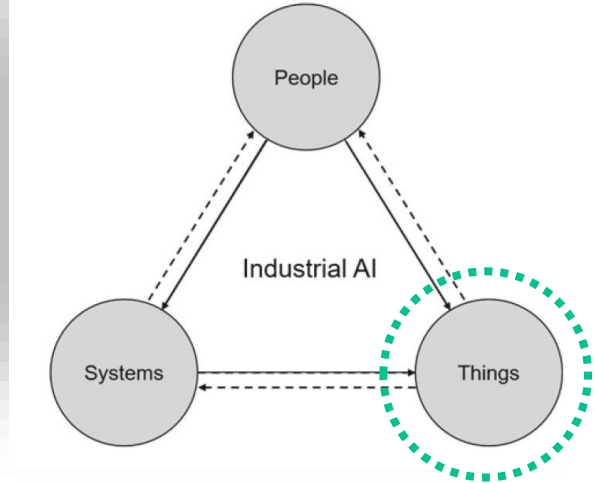

Fig. 2.9 The four quadrants of Industrial AI opportunity space (left); industrial big data in industry (right)

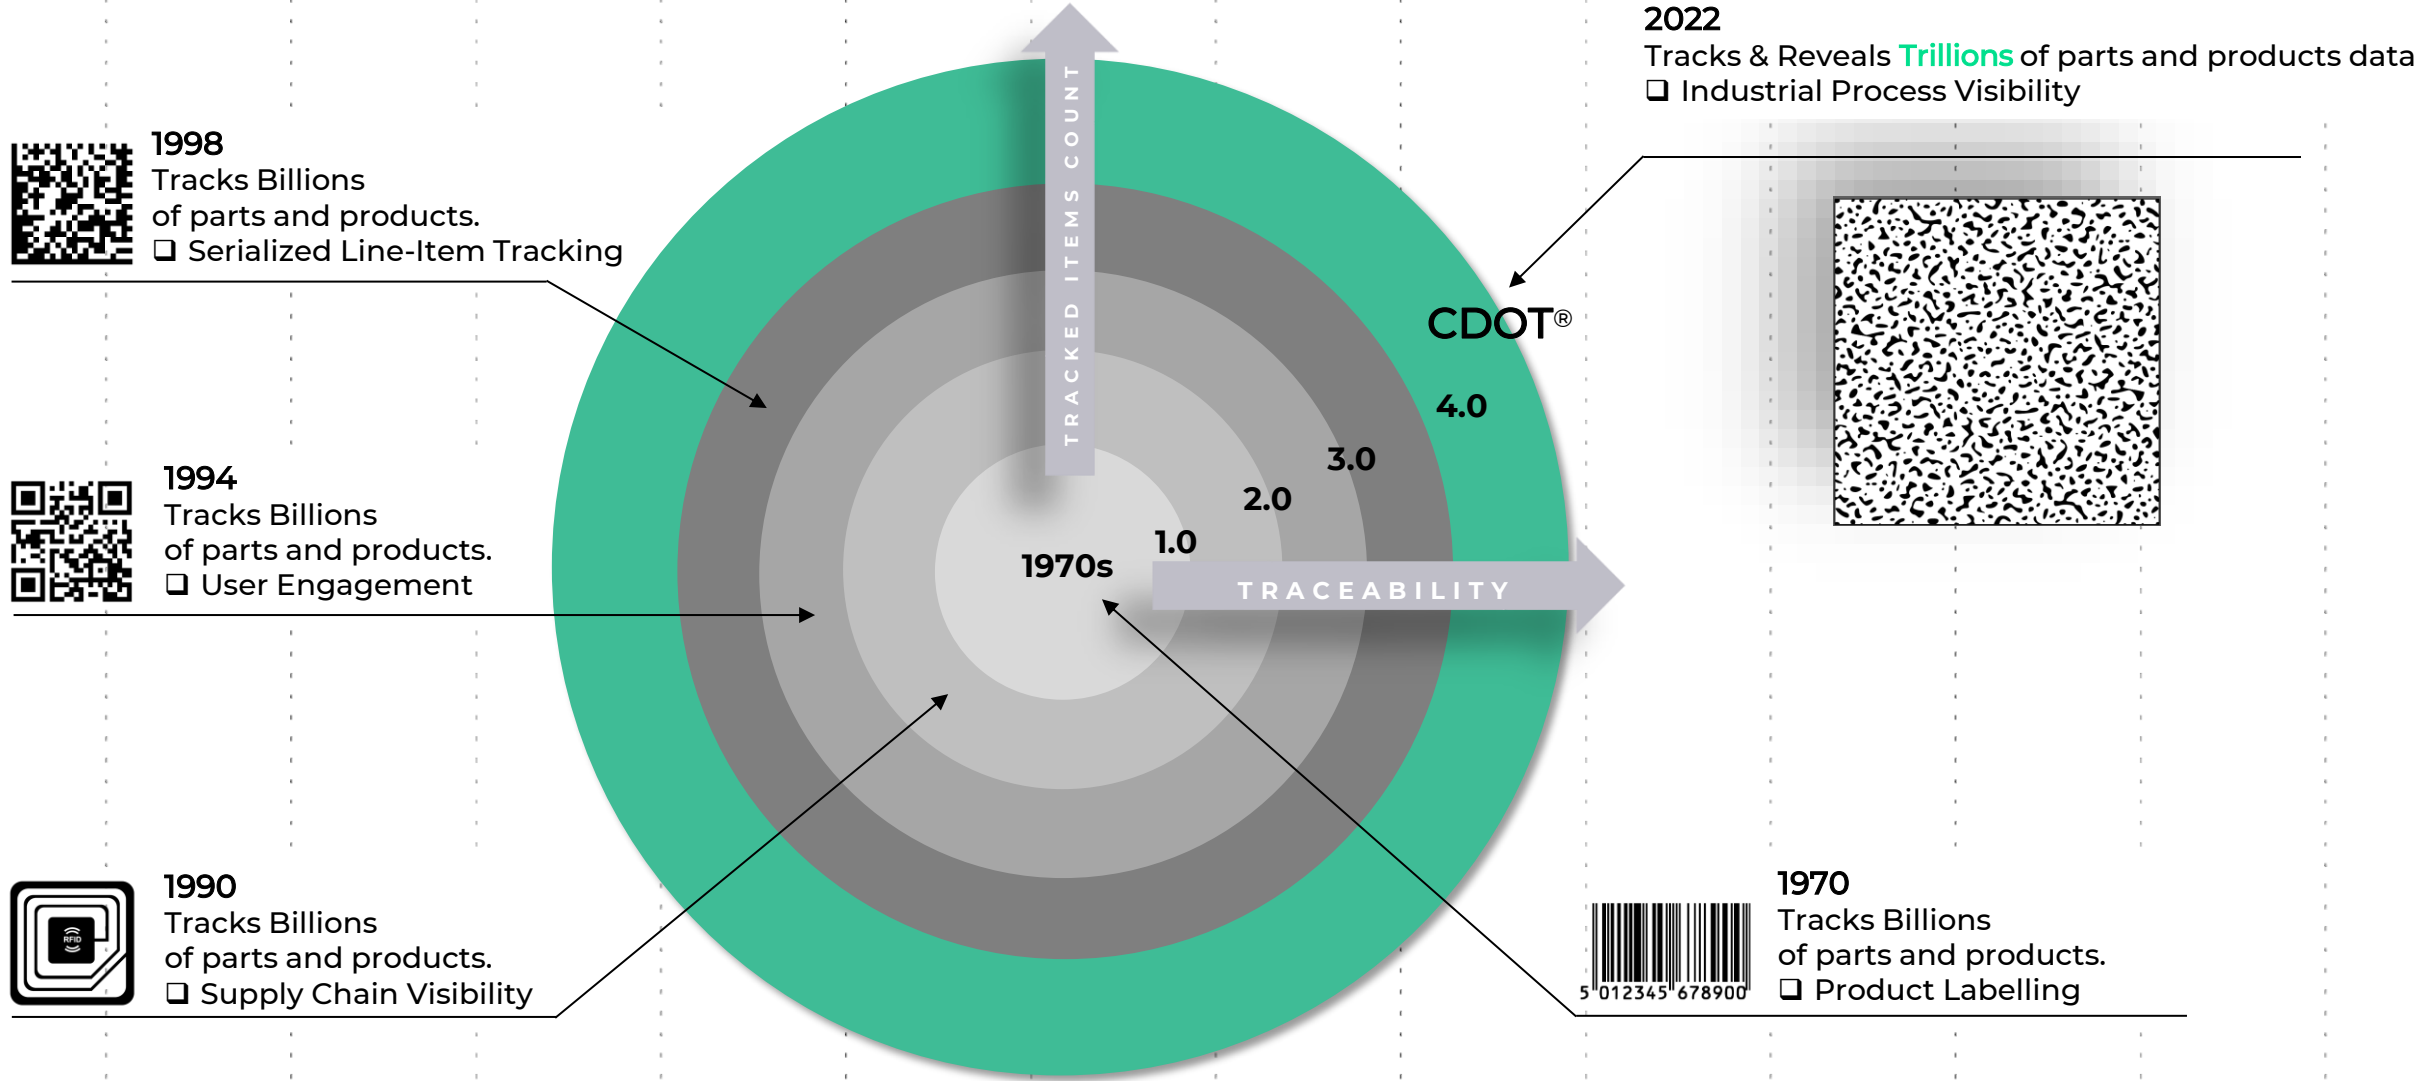

“Bad Data Quality: In industrial big data, data quality has constantly been an issue for many enterprises. This is mainly limited by the means of data acquisition in the industrial environment, including sensors, communication protocols, configuration software, and other technical constraints. The management technology of data quality is hard work for any enterprise.”

Industrial AI needs more Computable Things Data to promote its cyber space which in return will guide the physical space using the knowledge from cyber space.

Introducing CDOT® code

Tracking Trillions of parts and product data with AI-compatible CDOT code

1998
Tracks Billions of parts and products.
□ Serialized Line-Item Tracking

1994
Tracks Billions of parts and products.
□ User Engagement

1990
Tracks Billions of parts and products.
□ Supply Chain Visibility

1970
Tracks Billions of parts and products.
□ Product Labelling

2022
Tracks & Reveals Trillions of parts and products data
□ Industrial Process Visibility

CDOT®
4.0

TRACEABILITY

TRACKED ITEMS COUNT

What is the problem of <Bad Data Quality from Things> today?

Incumbent Physical ID codes cannot produce Digital IDs in 70% of the manufacturing cases.

Over \$1 trillion worth of parts left uncoded annually

Negatively Affected Industries

Aerospace
Aluminum Industry
Appliances Manufacturing
Automotive
Copper Industry
Carbon Fiber Industry
Casting & Forging Industry
Construction
Electronics
Energy Industry
Forest Industry
Glass Industry
Iron & Steel Industry
Machinery & Equipment
Oil & Gas
Precision Parts
Semiconductors
Wood Industry

Untraceable Cases

Cataphoresis
Die Casting
Drawing & Forming
Dusting & Rusting
Enameling
Firing
Galvanization
Glazing & Varnishing
Heat-Treatment
Low Light & Low Reading Angle
Metalized Coating
Painting
Paper Label Damages
Pickling (Acid Dissolution)
Sandblasting
Sand Casting
Scaling (Oxidation)

All current Physical ID codes cannot maintain their digital integrity in these cases, thus trillions of manufactured parts have bad data issues

1. Painting (up to 700µm)

2. Metallized Coating (up to 700µm)

3. Sand Casting

4. Die Casting (700°C hot part)

5. Die Casting (rough & shiny surface)

6. Small & Curved Surface

6. Heat Treatment

8. Galvanization

9. Pipe Drawing

Smooth implementation: no change to regular operations

CDOT Encoding, Decoding and CTRACE Tracking

CDOT CODE

1. Coding

- ❑ Customers can leverage serialized unique CDOT codes using laser marking machines which marks CDOT codes directly onto parts.

Compatible with All Printer / Marker Models for Writing

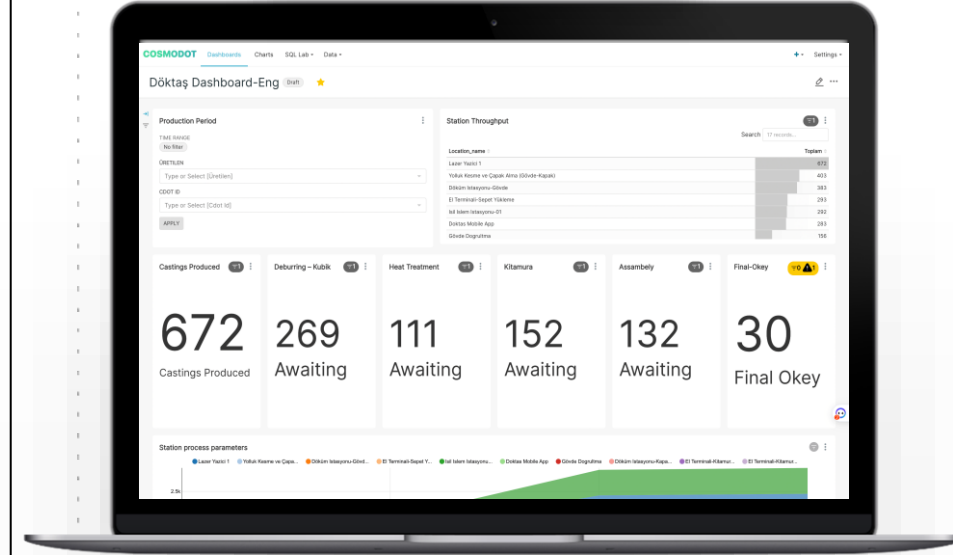

2. Decoding

- ❑ Customers decode CDOT codes on direct parts. Decoding can take place via options; (a) Customer Cloud, (b) Customer Local PC, (c) EDGE Device.

Compatible with All Camera / 2D Readers for Reading

CTRACE PLATFORM

3. Tracking (CTRACE)

- ❑ Real-time visibility, tracking and control from raw materials to the final product and beyond.
- ❑ Real-Time bi-directional data transfer between individual parts and products with PLCs and Third-Party software.

IMPLEMENTING A ROBUST CODING SYSTEM

75208

Sand Casting Production Harsh Environment

Extreme Heat
Up to 1400°C/2550F

Shot/Sand Blasting

Heat Treatment
Up to 540°C/1000F
for +3 hours

Exposure to
Dust – Rust - Acid

Initial testing and Preperation

CDOT Code on Sand Sample

CDOT code first trial with
50 Watt laser with 300mm lens

% 100 Readable CDOT Code
60 Watt Laser and 100mm Lens
